Title : Driving data simulation in Kyoto city

Recently, as you know, there are a lot of people from overseas for sightseeing. Especially in kyoto, this increase of travelers cause some problems such as traffic jam. to solve this problem, we proposed a service using traffic jam prediction. To make model predicting traffic jam, we needed to analyze driving data in kyoto city. However, because that data given to us are very very few, we had to generate dummy driving data by simulation based on some time series theory. In this session, I will introduce you how we generated it.
